OHASHI TOKIE**(54) NEOVASCULARIZATION INHIBITOR****(57)Abstract:**

**PROBLEM TO BE SOLVED:** To find out new pharmacological actions for an amide derivative.  
**SOLUTION:** This neovascularization inhibitor is obtained by carrying out neovascularization tests on the amide derivative by a neovascularization method for high oxygen load-induced retina and thereby finding out that the amide derivative has excellent inhibitory effects on the neovascularization. As a result, the amide derivative is expected to be useful as a therapeutic agent for diseases accompanied with the neovascularization such as proliferating diabetic retinosis, ophthalmic diseases such as premature infant retinitis, cancer diseases such as solid tumor or haemangioma and inflammatory diseases such as rheumatoid arthritis, psoriasis or scleredema.

**LEGAL STATUS**

[Date of request for examination]

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]

[Date of extinction of right]
